

Kunz precision AG

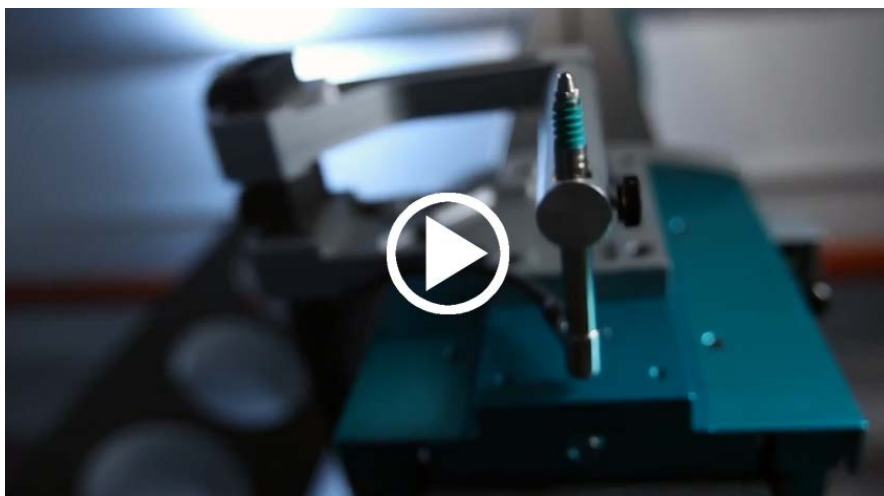

Reliability in metrology thanks to unique technologies

The specialty of the company Kunz precision when it was founded in 1980 was the maintenance of machine tools. Over the years, the company has evolved and today focuses on high precision measurement technologies, producing unique straightness and squareness measuring systems that work with our own vacuum air bearing technology.

The company Kunz precision uses TESA precision measuring instruments, such as probes, to manufacture its own systems.

As a result, Kunz precision is recognised as a reputable manufacturer and measurement services provider as well as an accredited calibration center on the national and international level.

What makes Kunz precision unique is the combination of product knowledge and measurement service. The company convinces in all areas and applications such as mechanical engineering, watchmaking, medical technology, national measurement institutes (such as METAS) and calibration laboratories.
